

Project Design Phase

Project Title

Virtual Agent-Driven SLA Breach Awareness and Justification System

Introduction

Many organizations struggle to monitor Service Level Agreement (SLA) deadlines effectively. Delayed responses, lack of timely notifications, and missing justifications for SLA breaches reduce customer satisfaction and operational efficiency. This project provides an automated ServiceNow solution using Virtual Agent, Flow Designer, and SLA Management to proactively notify users, collect breach justifications, and improve SLA compliance.

Expected Benefits

- Improved SLA compliance.
- Faster response to SLA risks.
- Automated justification collection.
- Reduced manual monitoring effort.
- Better audit readiness and compliance.
- Enhanced customer satisfaction.

Problems Identified

- Manual monitoring of SLA deadlines.
- Delayed identification of SLA breaches.
- Lack of timely alerts and reminders.
- No standardized process for capturing breach justifications.
- Increased risk of SLA violations.

4.1 Problem Solution Fit:

The proposed Virtual Agent-Driven SLA Breach Awareness and Justification System addresses the challenges of manual SLA monitoring, delayed breach identification, lack of timely notifications, and the absence of a standardized justification process. All justifications and approvals are securely recorded for audit and compliance purposes. By automating SLA awareness, justification collection, and reporting, the system reduces manual effort, improves SLA compliance, enhances accountability, minimizes service delays, and increases overall operational efficiency and customer satisfaction.

Problem-Solution Fit Canvas — Virtual Agent Driven SLA Breach Awareness & Justification System

Define CS, fit into CC, explore AS Focus on JPG, map into RC, understand EB Identify strong TR & EL, map CB	1. Customer Segment(s) CS Service Desk Agents, Team Leads / Operations Managers, and Clients/ Management receiving SLA reports in organizations with SLA-bound support.	2. Customer Constraints CC Limited agent bandwidth to track SLAs manually, strict contractual SLA commitments, automation budget, resistance to VA adoption.	3. Available Solutions AS Manual SLA tracking via spreadsheets, native ITSM timers without proactive alerts, email escalations, plain dashboards.
	4. Jobs-to-be-Done, Pains & Gains JPG Job: resolve tickets within SLA & justify breaches. Pains: missed deadlines, manual justification, client trust loss. Gains: proactive alerts, automated justification.	5. Root Cause RC Lack of real-time, automated SLA monitoring and Virtual Agent-driven alerts/justification leads to reactive, manual breach handling.	6. Existing Behaviour EB Agents manually check ticket status, managers chase updates verbally, justification reports prepared by hand after breach.
	7. Triggers TR Ticket nearing SLA deadline, SLA breach occurring, client escalation, audit/compliance review, recurring breach pattern.	8. Emotions EL Anxiety about missing deadlines, frustration with manual tracking, relief when alerted in time, stress justifying breaches to clients.	9. Channels of Behaviour CB Service desk portal, email/SMS alerts, Virtual Agent chat interface, SLA governance dashboard.
AB 10. Adoption Barriers: Trust in Virtual Agent recommendations, integration with existing ITSM/SLA engine, change management for agents, initial configuration of SLA rules & VA flows.			

4.2 Proposed Solution:

Project team shall fill the following information in the proposed solution template

S. No	Parameter	Description
1	Problem Statement	SLA breaches occur due to delayed responses, lack of timely alerts, and manual justification processes.
2	Idea / Solution Description	A ServiceNow Virtual Agent solution that sends SLA alerts, collects justifications, and automates

		notifications and updates.
3	Novelty / Uniqueness	Uses Virtual Agent with automated SLA monitoring, notifications, and justification collection.
4	Social Impact / Customer Satisfaction	Improves SLA compliance, faster issue resolution, and enhances customer satisfaction.
5	Business Model (Revenue Model)	Software-as-a-Service (SaaS) solution on the ServiceNow platform.
6	Scalability of the Solution	Easily supports growing users, incidents, and SLA records without affecting performance.

4.3 Solution Architecture:

The solution consists of a ticket management system, SLA monitoring engine, AI virtual agent, notification module, and reporting dashboard. The virtual agent analyzes ticket data, detects SLA risks, generates breach justifications, and sends real-time alerts to stakeholders.
